

Solution overview

CHRONIC CARE MANAGEMENT

Enli's cloud-based, EHR autonomous solution enables provider organizations to address key CCM program requirements, including beneficiary consent, care plan maintenance, transitional care management, care coordination, and care team time tracking.

Cohort selection

Identify eligible Medicare patients. Direct EHR integration and access to clinical data facilitates easy identification of eligible patients, and automatically imports them into the CCM workflow management program. This eliminates the need for manual population analysis and segmentation, and supports prospective CCM program enrollment.

Task & time tracking

Standardized care delivery across the care team. The out-of-the-box CCM task and time tracking dashboard aligns program-specific actions with team members responsible for delivering CCM services. This enables top-of-license work across the care team, and ensures that tasks and time are properly documented for reporting and reimbursement.

Reporting & billing

Automate the program reporting process. Easily generate reports and automatically submit for CCM service reimbursement through direct integration with the practice management system.

CASE STUDY

The Center for Primary Care

Delivering Chronic Care Management (CCM) Services

JOB

Establish team-based care delivery programs and workflows to engage eligible Medicare patients with CCM services, and capture CMS reimbursement.

CHALLENGE

EHR did not support task management for the care team. Program documentation and reporting required manual, paper-based workflows.

OUTCOME

Integrated patient engagement tools resulted in rapid program adoption. Collaborative tasking and tracking allowed for easy process reporting to CMS.

\$350K revenue attributed to CCM program in first year

ZERO additional staff was needed to deliver new services

The Enli® Platform

CareManager is a top-rated population health management software solution according to KLAS, Chilmark, Frost & Sullivan, and IDC Health Insights. With CareManager, providers can practice population health by identifying populations at risk, creating and monitoring care plans, and measuring the efficacy of their care.

Analytics

Clinical and financial insight identifies cohorts and predicts the value of early intervention.

Central Worklist

Cloud-based care team tasking engine that applies protocols to defined populations and informs the team of progress.

Point of care

Clinical decision support tool rendered in the EHR that is informed by evidence-based medical guidelines.
